Interaction: HCI vs InfoViz

(Yi et al., 2007)

“Foley et al. (1995) define an interaction technique as a way of using a physical input/output device to perform a generic task in a **human-computer dialogue**.”

The definition of interaction techniques in the context of Infovis should extend Foley’s definition, however, it was grounded in the general context of HCI. As Ware (2000) identifies via the phrase, “**asymmetry in data rates**”, the amount of data flowing from Infovis systems to users is far greater than from users to systems.

Thus, interaction techniques in Infovis seem more designed for **changing and adjusting visual representation** than for entering data into systems, which clearly is an important aspect of interaction in HCI.

We view interaction techniques in Infovis as the features that provide users with the ability to **directly or indirectly manipulate and interpret representations.**”

then details-on-demand

Types of interaction

- **Filtering**: only show me the data I am interested in $[F, Y_i, Sh, K]$
- **Selecting**: mark or track items I am interested in $[F, Y_i]$
- **Abstract & Elaborate**: show me more or less detail $[F, Y_i, K]$
- **Overview & Explore/Focus & Context**:
overview first, zoom and filter, details on demand $[F, Sh, K]$
- **Connect/Relate**: show me how this data is related $[F, Y_i, Sh, K]$
- **Reconfigure**: show me a different arrangement of the data $[F, Y_i, K]$
- **Encode**: show me a different representation of the data $[F, Y_i]$

- **Extraction of features**: allow me to extract data that interests me $[F, Sh]$
- **History**: allow me to retrace the steps I take $[F, Sh]$
- **Participation/Collaboration**: allow me to contribute to the data $[F]$
- **Gamification**: show me the data in a more playful way $[F]$

Filter: dynamic queries

Camera Filters:

- DSLR
- Max ISO: 3200
- Price: £326-£8686
- Canon

Quantitative attributes: sliders

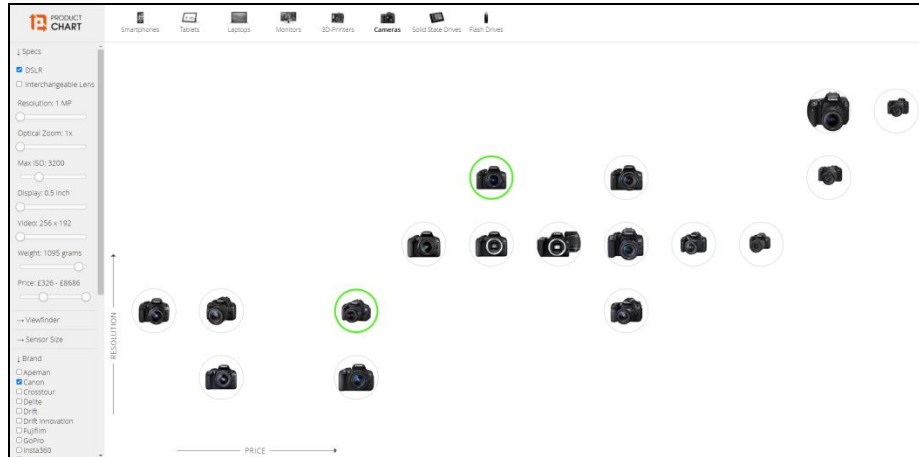

e.g. Price: £190 - £3429

Categorical attributes: check boxes

e.g. ☐ Interchangeable Lens

Select: highlighting items

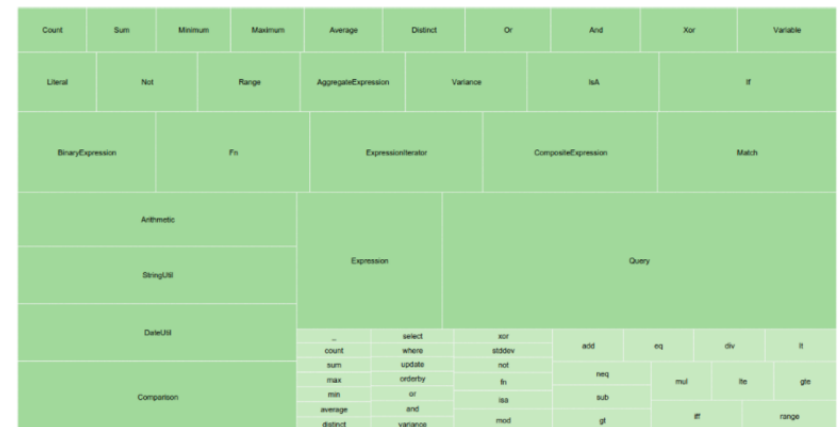

Abstract & Elaborate: zoom

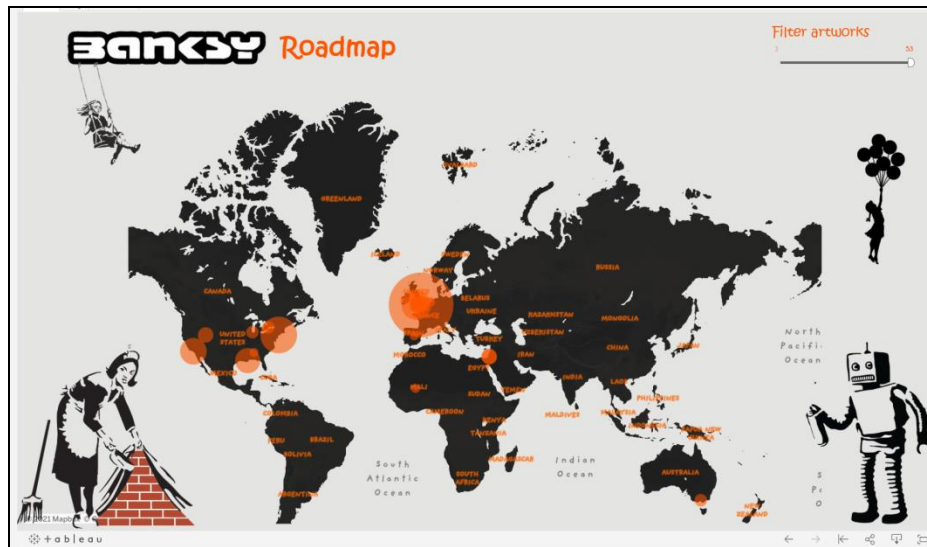

“Filter by navigation”
results in loss or gain of information

Focus & Context: distortion

Fish eye view of scatterplot matrix

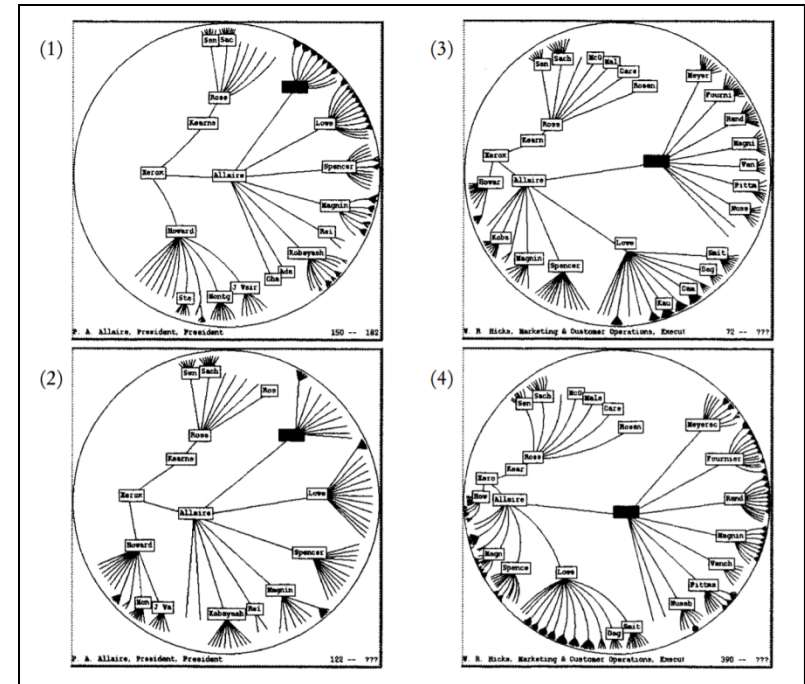

Linear **distortion** of metro map

Perspective Wall, for large volumes of linear data (e.g. chronological or alphabetical)

George Robertson, Jock D. Mackinlay, Stuart Card. The Perspective Wall: Detail And Context Smoothly Integrated, 1991.

Hyperbolic trees, for large hierarchies

John Lamping, Ramana Rao, and Peter Pirolli. A focus+context technique based on hyperbolic geometry for visualizing large hierarchies, 1995

Focus & Context: overviews

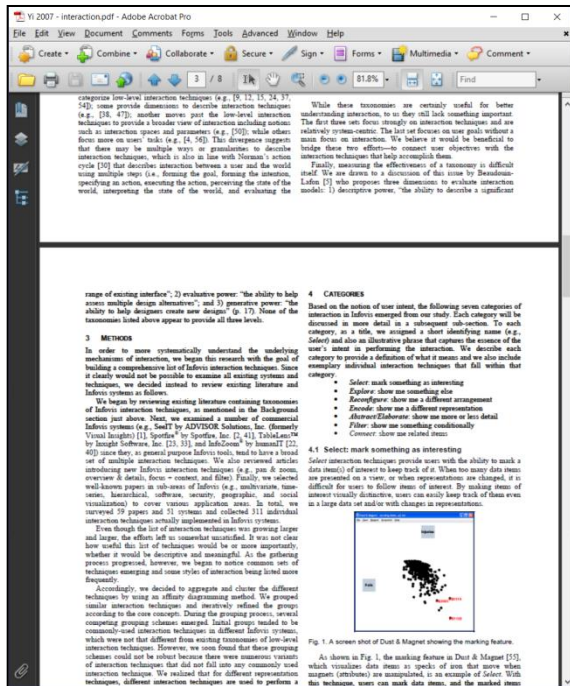

Fig. 1. A screen shot of *Direct & Magnet* showing the marking feature.

As shown in Fig. 1, the marking feature in *Direct & Magnet* [15], which visualizes data items as objects of data that move when magnified (enlarged) or un-magnified, is an example of *Select Mark* technique, users can mark data items, and the marked items

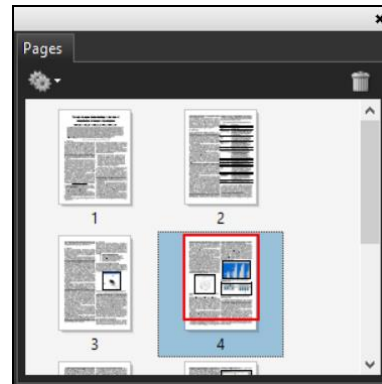

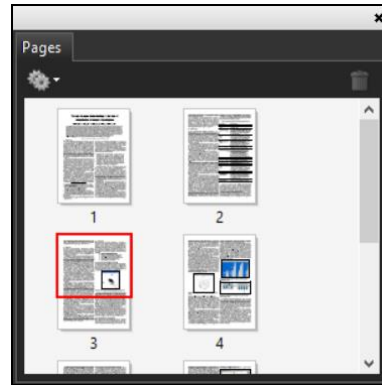

Fig. 2. A screen shot of *Visual Thesaurus* with the word "jet" at the center.

4.3 Reconfigures show me a different arrangement

Reconfigure interaction techniques provide users with different perspectives onto the data set by changing the spatial arrangement of representations. One of the essential purposes of infelicitous is to reveal hidden characteristics of data and the relationships between items. A fixed static representation often serves this purpose, but a single representation rarely provides sufficient perspectives. Thus, many infelicitous tools incorporate *Reconfigure* interaction techniques that allow users to change the way data items are arranged or the segment of data items in order to provide different perspectives on the data set.

The sorting and rearranging column operations in *TableLens* [33] are good examples of *Reconfigure* techniques. As shown in Fig. 3, by sorting the "Personnel" column, users can determine that horsepower values of vehicles are roughly correlated with cylinder displacement and weight. Also, users can rearrange the columns to compare attributes of interest side by side. Sorting and rearranging columns, the users frequently can be found in other infelicitous systems.

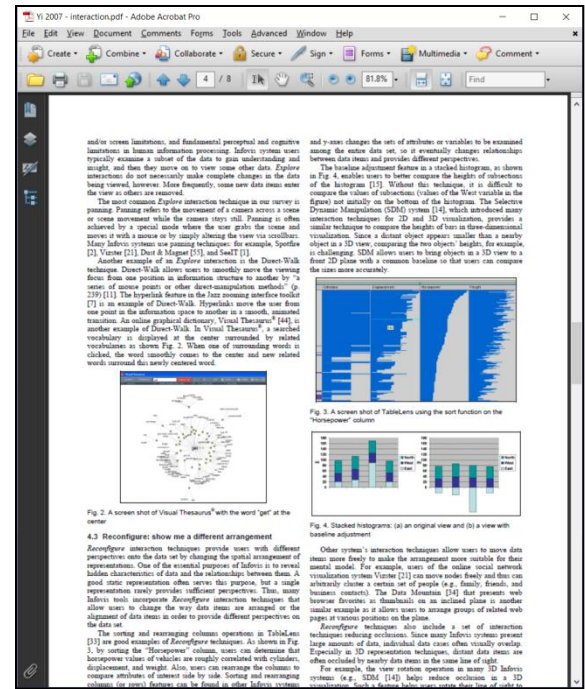

Fig. 3. A screen shot of *TableLens* using the sort function on the "Personnel" column.

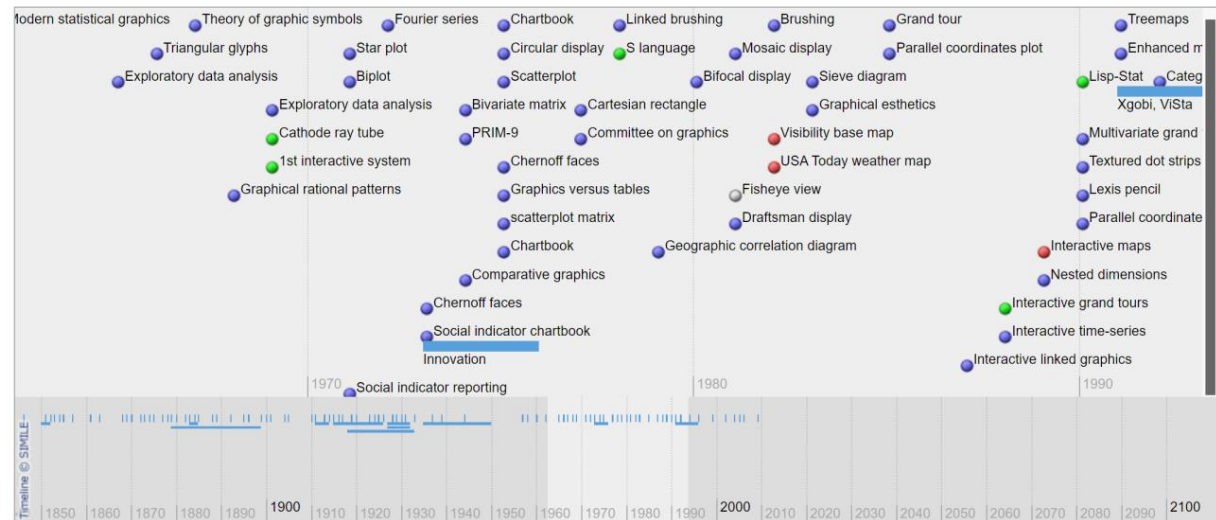

Fig. 4. Stacked histograms: (a) an original view and (b) a view with baseline adjustment.

Focus & Context: exposing details

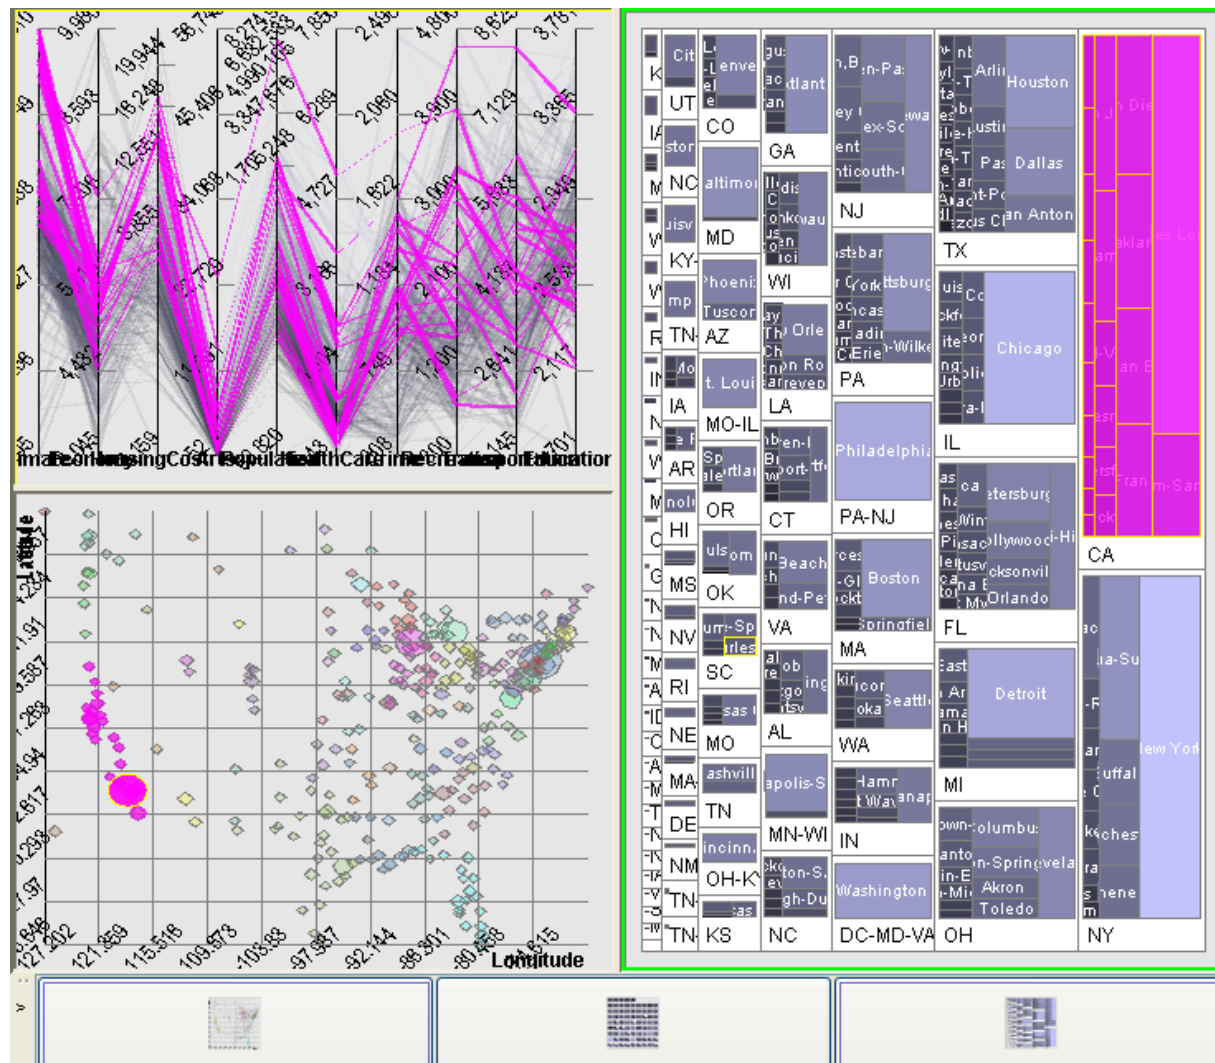

Sunburst - for large hierarchies

Connecting: multiple views

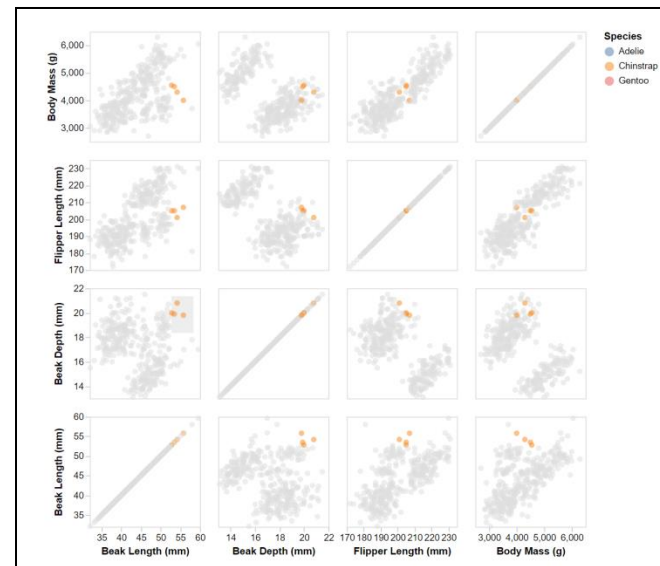

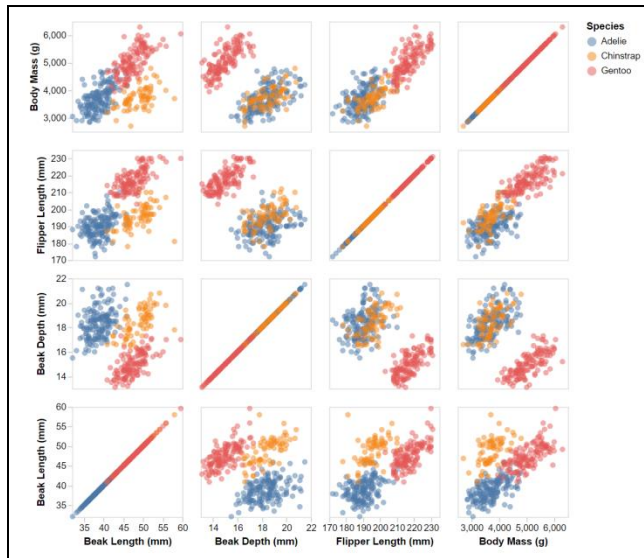

Multiple-linked and coordinated views:

- world map
- colour legend
- scatter plot
- table lens
- parallel coordinates

Connect: linking and brushing

Reconfigure: data choice

Age difference for nominees

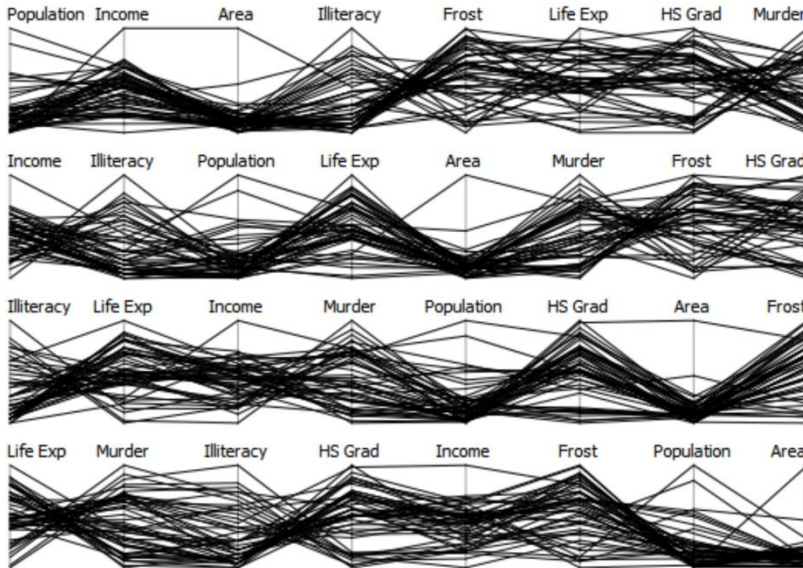

Actual age

Age difference for nominees

Actual age

Reconfigure: dimension order

The number of students studying different subjects in a high school

- left shows the set of popular and unpopular subjects clearly

Census data for 50 US states, showing relationships:

- top: Illiteracy/Frost (negative)
- bottom: Life Expectancy/Murder (negative)
- bottom: Illiteracy/HS Grad (negative)

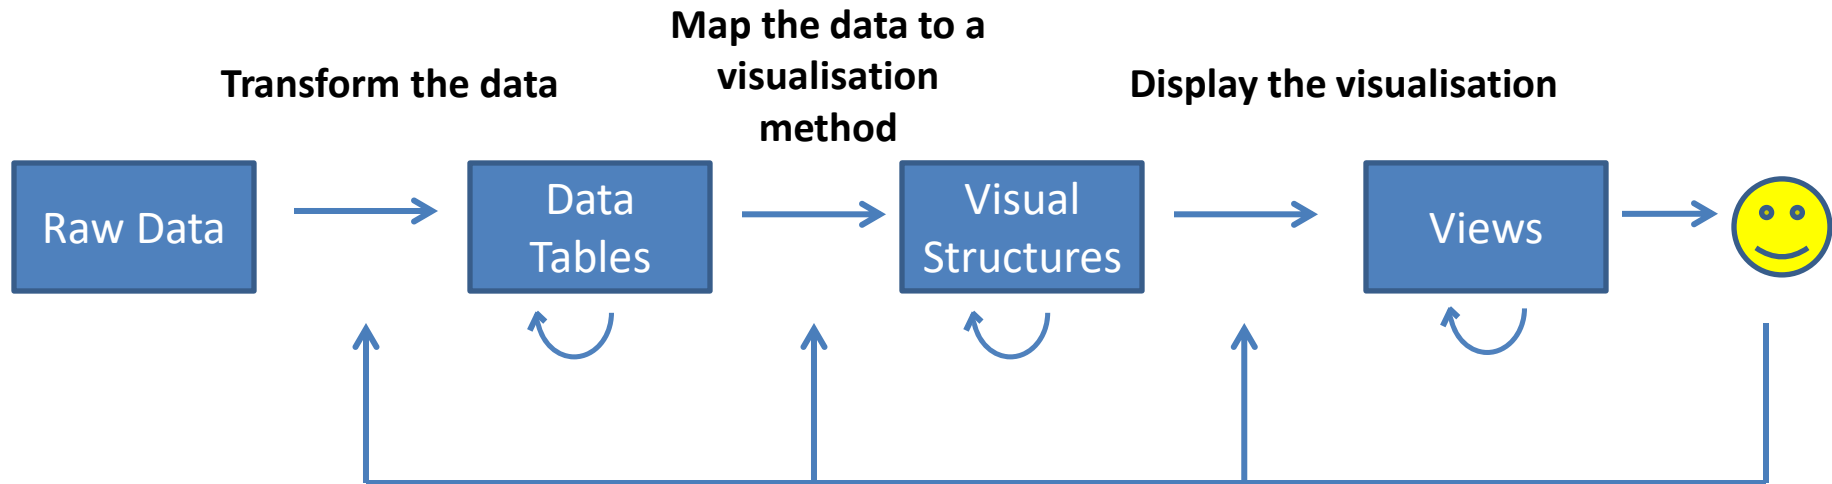

Encode

- Switch between views of the same data
 - e.g. scatterplot to clustered bar chart
- Change visual variables
 - e.g. colour, shape, line width
